Segment of the gene has been replaced by a segment of a foreign DNA CC segment of the gene has been replaced by a segment of a foreign DNA CC (1) use of thin aggregative fimbriae (SEP17/TAF) nucleation depended CC assembly system of strains of Salmonella, Escherichia coli and CC AgfA, CsgA and AgfA, homologue fimbriae (SEP17/TAF) nucleation depended CC AgfA, CsgA and AgfA, homologue fimbria subunits, respectively; (2) CC homologues species; (3) directing recombinant gene into the chromosome of the brooking recombinant gene into the chromosome of the CC back into the chromosome of the homologue species, replacing the native CC comprising separating an amino acid polymer comprising a remainal, cc protein containing a replacement segment or segments of foreign amino CC acid sequence or sequences grown on a Salmonella, E. coli or plymer into the expression of recombinant AgfA protein which is useful for the expression of recombinant AgfA protein which is useful for system the heterologous antigens are presented in high numbers (up to immunogenicity and adhesion properties are resented in high numbers (up to immunogens, which may be important for directing an immune response constitute the inserted epicope, and hybrid fimbrine are usually strong against the inserted epicope, and hybrid fimbrine are easy and the carrier to purify in large amount. The present sequence is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention de
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Recombinant agfA gene having a segment replaced by a foreign DNA sequence which encodes foreign epitope or antigen, expresses recombinant AgfA protein useful for eliciting immune response in animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Disclosure; Page 136;

CC segment of the gene has been replaced by a segment of a foreign DNA CC segment of the gene has been replaced by a segment of a foreign DNA CC sequence which encodes a foreign epitope or antigen. Also described are: (1) use of thin aggregative fimbriae (SER17/TAR) nucleation depended CC assembly system of strains of Salmonella, Estherichia coli and CC Enterobacteriaceae for the production of fimbriae comprising recombinant AgfA. CSGA and AgfA. homologue fimbrin subunits, respectively; (2) CC directing recombination of a recombinant gene into the chromosome of the homologous species; (3) directing recombinant gene into the chromosome of the copy of that gene; and (4) eliciting an immune response in an animal, CC comprising separating an amino acid polymer comprising a recombinant AgfA protein containing a replacement segment or segments of foreign amino CC acid sequence or sequences grown on a Salmonella, E. coli or Enterobacteriaceae host cell, from the host cell and introducing the polymer into the animal in conjunction with a carrier or diluent. (1) is useful for the expression of recombinant AgfA protein which is useful for S00,000 copies/cell), the hybrid fimbria protein both the carrier imbrial subunit proteins are usually strong immunogenicity and adhesion properties relevant for an efficient live vaccine, the carrier imbrial subunit proteins are usually strong CC against the inserted epitope, and hybrid fimbriae are easy and CC inexpensive to purify in large amount. The present sequence is given in the exemplification of the present invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Segment of the gene has been replaced by a segment of a foreign DNA CC sequence which encodes a foreign epitope or antigen. Also described are: (1) use of thin aggregative fimbriae (SEF17/TAF) nucleation depended CC assembly system of strains of Salmonella, Escherichia coli and CC AffA, CsgA and AgfA. Homologue fimbria subunits, respectively; (2) CC homologous species; (3) directing recombinant gene into the chromosome of the homologue species, replacing the native copy of that gene; and (4) eliciting an immune response in an animal, CC protein containing a replacement segment or segments of foreign amino CC acid sequence or sequences grown on a Salmonella, E. coli or CC Enterobacteriaceae host cell, from the host cell and introducing the estuiting an immune response in the texpression of recombinant AgfA protein which is useful for the expression of recombinant AgfA protein which is useful for computed the expression of recombinant AgfA protein which is useful for computed the expression of recombinant AgfA protein which is useful for computed the expression of recombinant AgfA protein which is useful for computed the expression of recombinant AgfA protein which is useful for computed the expression of recombinant AgfA protein which is useful for computed the expression properties are presented in high numbers (up to immunogenicity and adhesion properties relevant for an efficient live immunogens, which may be important for directing an immune response computed in the inserted epitope, and hybrid fimbriae are easy and the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches

CC The present invention describes a recombinant agfA gene (I) where a CC sequence of the gene has been replaced by a segment of a foreign DNA (CC (I) use of thin aggregative fimbriae (SEF17/TAP) nucleation depended CC assembly system of strains of Salmonella, Escherichia coli and CA AgfA, CsgA and AgfA-homologue fimbriae (SEF17/TAP) nucleation depended CC AgfA, CsgA and AgfA-homologue fimbria subunits, respectively, (2) cc homologous species; (3) directing recombination of a recombination of a recombinant gene into the chromosome of the homologous species, replacing the native comprising sequence of the homologous species, replacing the native comprising sequence of the homologous species, replacing the native comprising sequence or sequences of the homologous species in an animal. CC protein containing a replacement segment or segments of foreign amino CC protein containing a replacement segment or segments of foreign amino CC sequence or sequences grown on a Salmonella, E. coli or Enterobacteriaceae host cell, from the host cell and introducing the cC useful for the expression of recombinant AgfA protein which is useful for CC system the heterologous antigens are presented in high numbers (u) is CC ploymer into the animal in conjunction with a carrier or diluent. (I) is CC eliciting an immune response in an animal. In a fimbrial presentation CC immunogenicity and adhesion properties relevant for an efficient live computed the terminance of the hybrid fimbria protein segments both the carrier fimbrial subunit proteins are usually strong component the inserted epitope, and hybrid fimbriae are easy and consequence is given in the examplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                 Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          밁
The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA sequence which encodes a foreign epitope or antigen. Also described are: (1) use of thin aggregative fimbriae (SER17/TAR) nucleation depended assembly system of strains of Salmonella, Escherichia coli and Enterobacteriaceae for the production of fimbriae comprising recombinant AgfA, CsgA and AgfA-homologue fimbrin subunite, respectively; (2) directing recombination of a recombinant gene into the chromosome of the homologous species; (3) directing recombination of a recombination of the chromosome of the back into the chromosome of the homologous species, replacing the native copy of that gene; and (4) eliciting an immune response in an animal, agfA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Salmonella; agfa; chromosomal gene replacement; vaccine; immune response; immunogen; ds.
                                                                                                                                                                                                    Disclosure;
                                                                                                                                                                                                                             Recombinant agfA gene having a segment replaced by a foreign DNA sequence which encodes foreign epitope or antigen, expresses recombinant AgfA protein useful for eliciting immune response in animal.
                                                                                                                                                                                                                                                                                                                                          White
                                                                                                                                                                                                                                                                                                                                                                                                  05-APR-1999;

(I) is useful for the expression of recombinant AgfA protein which is useful for celiciting an immune response in an animal. In a finbrial presentation system the heterologous antigens are presented in high numbers (up to 500,000 copies/cell), the hybrid fimbrin protein possesses both the immunogenicity and adhesion properties relevant for an efficient live vaccine, the carrier finbrial subunit proteins are usually strong immunogens, which may be important for directing an immune response against the inserted epitope, and hybrid fimbriae are easy and inexpensive to purify in large amount. The present sequence is given in the exemplification of the present invention

CC Regment of the gene has been replaced by a segment of a foreign DNA CC sequence which encodes a foreign epitope or antigen. Also described are: (1) use of thin aggregative fimbriae (SEF17/TAF) nucleation depended CC assembly system of strains of Salmonella, Escherichia coli and CC AgfA, CsgA and AgfA-homologue fimbriae comprising recombinant CC homologous species; (2) directing recombination of a recombinant gene into the chromosome of the homologous species, replacing the native comprising separating an amino acid polymer comprising a replacement segment or segments of foreign amino CC acid sequence or sequences grown on a Salmonella, E coli or coli and CC eliciting an immune response in an animal. For the expression of recombinant gene comprising separating an amino acid polymer comprising the native comprising separating an amino acid polymer comprising a replacement segment or segments of foreign amino CC acid sequence or sequences grown on a Salmonella, E coli or collinate the containing a replacement segment or segments of foreign amino CC eliciting an immune response in an animal for collinate and introducing the ccuseful for the expression of recombinant AgfA protein which is useful for system the heterologous antigens are presented in high numbers (up to companion), the hybrid fimbrian protein possesses both the vaccine, the carrier fimbrial subunit proteins are usually strong capainst the inserted epitope, and hybrid fimbriae are easy and colination of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                               Matches

CC Segment of the gene has been replaced by a segment of a foreign DNA CC (1) use of thin aggregative fimbriae (SEP17/TAF) nucleation described are: CC assembly system of strains of Salmonella, Escherichia coli and CC (1) use of thin aggregative fimbriae (SEP17/TAF) nucleation depended CC Enterobacteriaceae for the production of fimbriae comprising recombinant CC directing recombination of a recombinant gene into the chromosome of the copy of that gene; and (4) eliciting an immune response in an animal, CC protein containing a replacement segment or segments of foreign amino CC Enterobacteriaceae host cell, from the host cell and introducing the cuseful for the expression of recombinant AgfA colymer into the animal in conjunction with a carrier or diluent. (1) is CC eliciting an immune response in an interface cuseful for the expression of recombinant AgfA protein which is useful for copies/cell), the hybrid fimbrin protein possesses both the CC vaccine, the carrier fimbrial subunit proteins are usually strong cimmunogenicity and adhesion properties relevant for an efficient live cimmunogenic, which may be important for direction as usually strong. proteins are usually r directing an immune

Recombinant agfA gene having a segment replaced by a foreign DNA sequence which encodes foreign epitope or antigen, expresses recombinant AgfA protein useful for eliciting immune response in animal.

Disclosure; Page 137; 139pp; English.

CC Agfa, CsgA and Agfa-homologue finbrin subunits, respectively, (2)

CC directing recombination of a recombinant gene into the chromosome of the homologous species; (3) directing recombination of a recombination of a recombinant gene combinant gene into the chromosome of the homologous species, (3) directing recombination of a recombinant gene coback into the chromosome of the homologous species, replacing the native copy of that gene; and (4) eliciting an immune response in an animal, and comprising separating an amino acid polymer comprising a recombinant Agfa protein containing a replacement segment or segments of foreign amino caid sequence or sequences grown on a Salmonella, E. coli or conjumer into the animal in conjunction with a carrier or diluent. (I) is useful for the expression of recombinant Agfa protein which is useful for celiciting an immune response in an animal. In a fimbrial presentation conjunction with a carrier or diluent. (I) is cusful for the heterologous antigens are presented in high numbers (up to 500,000 copies/cell), the hybrid fimbrin protein possesses both the carrier fimbrial subunit proteins are usually strong immunogens, which may be important for directing an immune response capainst the inserted epitope, and hybrid fimbriae are easy and conversed to purify in large amount. The present sequence is given in the exemplification of the present invention The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA sequence which encodes a foreign epitope or antigen. Also described are: (1) use of thin aggregative fimbriae (SEF17/TAF) nucleation depended assembly system of strains of Salmonella, Escherichia coli and Escheriaceae for the production of fimbriae comprising recombinant

CC directing recombination of a recombinant gene into the chromosome of the chromosome of the chromosome of the corp.
CC back into the chromosome of the homologous species, replacing the native copy of that gene; and (4) eliciting an immune response in an animal, cc copy of that gene; and (4) eliciting an immune response in an animal, cc comprising separating an amino acid polymer comprising a recombinant AgfA acid sequence or sequences grown on a Salmonella, E. coli or polymer into the animal in conjunction with a carrier or diluent. (I) is cc polymer into the expression of recombinant AgfA protein which is useful for the expression of recombinant AgfA protein which is useful for system the heterologous antigens are presented in high numbers (up to immunogenicity and adhesion properties relevant for an efficient live vaccine, the carrier fimbrial subunit proteins are usually strong capainst the inserted epitope, and hybrid fimbriae are easy and consensive to purify in large amount. The present sequence is given in the exemplification of the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The DNA encodes the Salmonella enteritis27655-3b TnphoA mutant strain agfA gene cloned into pUC19. The DNA and isolated proteins are used in genetic immunization and vaccine compositions, respectively, to elicit an immune response to Salmonella in animals (e.g. food producing animals) and humans. The nucleic acid can be used to provide diagnostic assays for Salmonella and/or enteropathogenic bacteria of the family Enterobacteria. It can also be used to provide proteins and antibodies which can be used for assays. The nucleic acid sequence can be used to provide probes or primers which can specifically hybridise to nucleic acid molecules from greater than 99% of Salmonella strains that are pathogenic to warm-blooded animals relative to nucleic acid molecules from virtually all other microbial organisms. (Updated on 25-MAR-2003 to correct PF field.)
